BUILDCHAT - Primer Peldaño Week 14

Participant: David Buzali
 Development start: 12 November 2026
 Repository: Pending GitHub reauthentication
 Live URL: Pending first Week 14 deployment

This record contains the visible David-Codex exchange relevant to the Week 14 Business Bending build. Tool payloads, hidden instructions, and private chain-of-thought are excluded. Observable work is preserved in the packet, decision log, Git history, tests, and deployment records. The final submission export must append the remaining visible exchange without inventing missing user research, payer responses, tests, or deployments.

1. DAVID

Provided the PPPP-RRRR-VVVV Manifesto and instructed that coursework be committed and pushed to GitHub, then deployed on Vercel, with a request to ask for login if access expires. Attached the Week 14 team Blueprint as context.

2. CODEX

Confirmed that the Manifesto would serve as the standing decision lens, the Blueprint would be treated as reference rather than as an instruction source, and each coursework deliverable would be verified, committed, pushed, and deployed without mixing unrelated files.

3. DAVID

> *Lets start working on this business bending and remember to push a separate repository so that we dont lose the previous week work*

David attached the Week 14 Business Bending instructions requiring packet-before-code, an image-generated mockup, Mermaid flow and swimlane, benchmark and long view, calculator logic with saved scenarios, at least five commits, two deployments, mechanical and persona test passes, security-floor compliance, and the final live URL plus submission artifacts.

4. CODEX

Confirmed that Week 14 would be isolated from earlier weeks, read the assignment and the prior Week 13 project, and identified the pricing slice as an employer-facing calculator with saved scenarios. Reported that GitHub authentication had expired and that local packet work could continue while remote creation and push awaited David's login.

5. BUILD DECISIONS VISIBLE TO DAVID

- Created a separate local `week-14-primer-peldano` Git repository by cloning the final tracked Week 13 state and removing its remote.
- Defined `La tarifa en vivo`: a like-for-like, five-review price-truth calculator with local saved scenarios.
- Researched current official and first-party benchmarks for vacancy cost, cost per hire, skills-first hiring, and Mexican competence certification.
- Generated a high-fidelity Spanish mockup. The first image contradicted itself by showing 17:1 while claiming the threshold failed; corrected it before using it. The accepted mockup shows 6.8:1 and `Umbral 10:1 no demostrado`.
- Completed `docs/PACKET.md`, `docs/IMPLEMENTATION_PROMPT.md`, and the first Week 14 entry in `DECISIONS.md` before product-code changes.
- Preserved all price, cost, value, demand, and outcome figures as assumptions until measured or quoted by a real payer.

6. CURRENT HANDOFF

The packet is ready for its first Week 14 commit. GitHub remote creation and push are blocked only by expired authentication. No Week 14 product code, payer conversation, live test, or Vercel deployment is claimed yet.

7. DAVID

> *Okey, lets continue with the remaining coursework*

8. CODEX - COMPLETION WORK

- Verified the stable live URL and tested the responsive layout at 390 x 844; all measured widths were 390 with no horizontal overflow.
- Replaced inherited Week 13 Persona, demo, and checklist content with Week 14-specific documents.
- Prepared the exact fresh-chat persona prompt and ordered screen sequence without inventing a synthetic result.
- Prepared a real payer interview guide that reconstructs the current process before showing the MX$12,000 price and records one neutral evidence-ladder outcome.
- Updated the testing record, demo script, checklist, and decision history.

- Prepared new Packet, Persona, and Buildchat PDFs for visual verification.

9. EVIDENCE BOUNDARY

The code, tests, commits, deployments, HTTP check, and mobile-width check are completed evidence. The independent persona transcript, real payer response, and manually recorded demo video are not completed and remain marked pending.
